Rarebooksclub.com, United States, 2012. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book ***** Print on Demand *****.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1916 Excerpt: .an hypothesis need not be considered. Thus the data obtained by the writer are not only in harmony with the theory that albinism, red-eye, and intensity form a series of triple allelomorphs, but can be explained on no other basis, barring the possibility just noted. DILUTION. Such color varieties as agouti, black, brown, yellow, etc., are sharply distinct from each other. They segregate from crosses without producing intergrades and in unforced agreement with Mendelian expectation. In contrast with these discontinuous variations are the continuous variations in the intensity of color of each main color variety. Thus, among the yellows, there are all gradations from a pale cream to an intense red. Among the agoutis, there are the pale silver agoutis, the intense golden agoutis, and the intermediate yellow agoutis. There are all grades of dilute blacks known to the fanciers as blues, for which term, as has been explained, sepia is substituted in this paper. Finally, there are all grades of dilute browns and cinnamons. (See plates 1 and 2.) The existence of these dilute types was noted by Castle (1905) and Solla (1909), both of whom also recognized that dilution could be transferred from one series to another, e. g., from creams to blacks, giving rise to sepias. They did not, however, suggest any factorial explanation, finding the results of crosses highly irregular. Detlefsen (1914) considered dilution to be recessive, but found the inheritance of dilution very irregular among *C. rufescens* hybrids. He obtained dilutes...
